

SOFTWAREUNLIMITED

Our case studies highlight how Information Technology (IT) can be used to enhance your competitive position through reduced costs, improved operational efficiencies and higher levels of customer service.

Case Study: Security

Find out how one company used Secure IT to protect their information assets from internal employee threats as well as Internet intruders and competitors.

Client Situation

A large company is concerned about the integrity of their network. Nightly tape backups are being performed but are not verified for accuracy. Anti-virus software is installed but is not updated. Employees have access to most files on the server and the files are not organized by business function. The company has a high speed connection to the Internet.

Client Problem

Employee productivity is on a decline as the volume of work is increasing. The high speed connection to the Internet has little internal protection and compromises the integrity of the client data.

SoftwareUnlimited Solution

SoftwareUnlimited's Secure IT service implements a formalized system backup schedule with off-site rotation. Anti-virus software is automatically updated on a weekly basis using the high speed connection to the Internet. Files on the network are organized by business function and employee network access restrictions are implemented.

SoftwareUnlimited's Secure IT service installs a firewall to protect against intruders. Encryption and document archival/destruction solutions are implemented to protect the confidentiality of information. Employee Internet access is restricted and monitored.

Our Secure IT service provides a security assessment, penetration analysis with security analysis software and a review of the client's Security Policy and Procedures Manual. Corrective action is implemented to correct security vulnerabilities.

Internet intruder monitoring is provided 24 hours a day, 7 days a week through SoftwareUnlimited's Ensure IT service.

Client Benefit

The client's productivity is increased by 30%. Employees can access files from organized folders on the server. Data integrity is increased from better protection of client's information on the network. The client's network is secure and protected from Internet intruders.

Contact us to find out how we can help you increase the integrity of your network while improving employee productivity.
