

The Top 10 Tips To Protect Your “Information Assets”

Concerned that your automated systems control so much of your business that you risk losing money? Use our Top 10 Security tips to protect your “information assets”. Contact us if you would like more information on our **Secure ITSM** security services.

The Top 10 Tips To Protect Your Information Assets

1. Security Policies – Don’t Risk Client Trust
2. Backups – Your Initial Defense
3. Viruses – Your Constant Threat
4. Passwords – What You Need To Know
- 5. Employees – Your Hidden Threat**
6. Hackers – What You Need To Know
7. Firewalls – What They Can’t Do For You
8. Security Assessments – A Subscription Service
9. Encryption – Protecting Your Data
10. Documents – Managing Your Risk

5. Employees – Your Hidden Threat

You have probably taken steps to secure your systems from external “hacker” threats. But what steps have you taken to protect your organization from your own employees? From the inside, employees bypass many of your controls designed to protect your data from unwanted intruders. Even if you maintain passwords on confidential documents, employees can run scripts that detect and remove passwords on files. How can you address this employee threat? Identify your vulnerabilities and integrate security solutions at the network level.

Why you need formalized network protection

- Your employees already have access to your network
- Employees don’t have to pass through external security checkpoints
- Your confidential data needs more than password protection

Your risks

- Employees lose ability to securely store files
- Files are stored on local workstations and are not properly backed up and/or stored off-site
- Increased costs due to inadequate network protection
- Your image and reputation may be compromised
- Customer dissatisfaction from loss of data integrity

Security Readiness

The Computer Security Institute estimates that between 60% and 80% of network misuse comes from within the enterprise. Protection from your internal employees is a critical component of your security readiness. Enhance and enforce security at the network level. Managing your employees and their access to data help you manage your risks.

Call us today and find out how our **Secure ITSM** security services can help protect your information assets.
